                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                               Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. Lowprising one of 13109 defined nucleotide sequences given in the specification (or complements). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from WIPO at the printed specification for this patent does not appear in the printed specification fire. Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease;

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes it the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung measuring the array with a measure mannal to each probe of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma; lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphanjoleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplacia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                     tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangiolelomyomtosis; Karagener syndrome; pulmonary alveolar proteinlosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Spatially-addressable set of single exon nucleic acid probes, used to
familial idiopathic pulmonary fibrosis; neurofibromatosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                measure gene expression in human lung samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 27; SEQ ID NO 35724; 634pp; English.

antiviral activity. The novel hybrid polypeptide is useful for decreasing viral infection and modulating intracellular processes involving coiled-
ool peptide interactions. The novel hybrid polypeptide comprises insulin or its fragment, so the core polypeptide is useful for ameliorating the symptoms of forms of diabetes. The novel hybrid polypeptide is also useful as a part of prognosis for preventing disorders including fusion events and viral infection that involves cell-cell and/or virus-cell fusion, and for diagnosis and in vivo imaging methods. This sequence represents an enhancer peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New hybrid polypeptide for modulating fusogenic events for e.g. antiviral activity, has enhancer peptide sequence derived from retroviral envelope protein sequences linked to core polypeptide e.g. therapeutic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel hybrid polypeptide comprising an enhancer peptide sequence linked to a core polypeptide. The enhancer peptide sequence comprises WQRWEQKI or WASLWEWF. The invention also includes novel peptides that exhibit anti-fusogenic activity, antiviral activity and/or ability to modulate intracellular processes. The novel hybrid polypeptide has virucide and antidiabetic activity. The enhancer peptide sequence enhances pharmacokinetic properties of any core polypeptide, for example, a polypeptide useful for the treatment or prevention of a disease, or an imaging agent useful for mediating tusegenic consecution in the novel when the core polypeptides and whibit antifusogenic or antiviral activity. The novel hybrid polypeptides are suseful for modulating fusogenic events and exhibit antifusogenic or antiviral activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes human lung specific polypeptides (LSP, (I)) and lung specific nucleic acids (LSNA, (II)). Also described: (1) and lung specific nucleic acids (LSNA, in a sample: (2) a vector (III) comprising (III); (3) a host cell comprising (III); (4) a polypeptide (IV) comprising (III); (4) a polypeptide (IV) comprising (III); (4) a polypeptide (IV) encoded by (II); (5) production of (IV); (6) an antibody (V) or its fragment that specifically binds to an LSP; (7) determining (M2) the presence of an LSP in a sample; (8) a kit for detecting a risk of cancer or presence of (I) or (II) in a sample of the patient; and (9) a vaccine comprising (I) or (II). LSP and LSNA sequences have cytostatic actin inmune response. (I) and (II) can be used for diagnosing or monitoring the amount of the determined nucleic acid molecule or the polypeptide in the sample of the patient, and comparing the cample of the patient to the amount of the nucleic acid molecule or the polypeptide in the sample compared to the amount of the nucleic acid molecule or the polypeptide in the compared to the amount of the nucleic acid molecule or the polypeptide in the sample compared to the amount of the nucleic acid molecule or the polypeptide in the nucleic acid molecule or the polypeptide in the compared to the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of the amount of (I) or (I) induces an immune response against the amount of (I), and of the amount of (I), a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used in gene therapy, for producing transgenic animals and cells, and for producing engineered lung tissue for treatment and research. (II) is also useful for detecting or amplifying nucleic acid molecules that have similar or identical nucleic acid sequences compared to (II). (I) is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (II) can be
human; lung specific polypeptide; LSP; lung specific nucleic acid; LSNA; lung; cytostatic; vaccine; gene therapy; immune response; lung cancer; metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                monitoring, staging, imaging and treating lung cancer and non-cancerous disease states in lung, for identifying lung tissue, and monitoring, identifying and/or designing agonists and antagonists of (I). receiving kidneys stored in We solution (defined in the specification) alone. Lower serum creatinine levels of less than half of those observed in control animal alone. Lower serum creatinine levels are indicative of healthier kidneys and a more preferable prognosis for the transplant patient. The media of the invention are useful for decreasing the incidence and/or severity of delayed graft function in patients receiving transplanted kidneys stored and/or treated in the media. The media may also be used in procedures such as cardioplegia. It is contemplated that transplant of healthier organs leads to a decrease in chronic rejection. This sequence represents an antimicrobial defensin peptide studied in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Media comprising antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds useful for the storage and preservation of organs prior to transplant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes new transplant compositions comprising antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds. The media is capable of extending the preservation period past 72 hours and can provide organs with increased functionality upon transplant. animals receiving kidneys stored in the media of the present invention for either three or four days had serum creatinine levels of less than half of those observed in control animals receiving kidneys stored in UW solution (defined in the specification) and more preferable prognosis for the transplant patient. The media of the invention are useful for decreasing the incidence and/or severity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transplant, antimicrobial peptide, pore forming agent, cardioplegia; cell surface receptor binding compound; kidney transplant; cardioplegia; organ transplant; transplant rejection; defensin.

delayed graft function in patients receiving transplanted kidneys stored and/or treated in the media. The media may also be used in procedures such as cardioplegia. It is contemplated that transplant of healthier organs leads to a decrease in chronic rejection. This sequence represents an antimicrobial defensin peptide studied in the development of the

New antigenic polypeptides from Staphylococcus aureus or S. epidermidis, useful as a vaccine for immunizing humans against e.g. bacteremia, septic septicemia, tuberculosis, meningitis, pneumonia, gonorrhea or impetigo.

Claim 4; Page 163; 189pp; English.

The present invention describes an antigenic protein or its part, which is for use as a vaccine. The antigenic protein is encoded by an isolated DNA molecule of Staphylococcus aureus or S. epidermidis partial gene sequences (designated dnaSA and dna SB, respectively; and which encodes a protein expressed by a pathogenic organism. Also described: (1) a vaccine composition comprising at least one antigenic protein; (2) a method of immunishing an animal against a disease or condition caused by a pathogenic microbe by administering the antigenic protein or the vaccine; (3) an antibody or its binding part obtainable by the method above; (4) preparing a hybridoma cell line producing monoclonal antibodies; (5) a

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe

                                                                                                                                                                                                          fascitis, impetigo, histoplasmosis, Lyme disease, gastro-enteritis, dysentery, shigellosis, S. aureus-associated septicaemia, food-poisoning, skin disorders, S. epidermidis-associated septicaemia, peritonitis or endocarditis. The present sequence represents a S. aureus antigenic protein sequence from the present invention.
            opsonic antigeness expressed by a pathogenic microbe. The antigenic proteins have antibacterial, neuroprotective, immunosuppressive, antiinflammatory, antiulcer, immunostimulant and ophthalmological activities, and can be used in vaccines. The antigenic proteins or vaccines can be used for immunisting an animal (specifically a human) against a disease or condition caused by a pathogenic microbe, e.g. bacteraemia, septic shock, organ infection, skin infection, bacterial basal colonisation, bacterial eye infections, septicaemia, tuberculosis, bacteria-associated food poisoning, blood infections, peritonitis, endocarditis, sepsis, meningitis, pneumonia, stomach ulcers, gonorrhoea, strep throat, etreptococcal-associated toxic shock, necrotising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                    format
                                                                                                                                                                                                                                                                                                                      Peptide #5794 encoded by probe for measuring placental gene expression.
                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
of the invention. Note: The sequence data for this patent did not part of the printed specification, but was obtained in electronic directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a single exon nucleic acid probe (SENP) [1] for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification for complements fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. [1] may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                         Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide #567 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                    Claim 27; SEQ ID NO 25703; 639pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match 1.8%; Score 6; DB 4; Length 43; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical sepithalial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for analyzing
               Peptide #557 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                           Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                               The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placents. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                 Human; microarray; single exon probe; gene expression; breast; disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the
                                                                                                                                                                                                        0; Gaps
                                                                                                                                                                                                                                                                                                                                                            Peptide #547 encoded by breast cell single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 27; SEQ ID NO 10864; 327pp + Sequence Listing; English.

                are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed sequence by the second of the invention of the printed of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; reproductive system related antigen; reproductive system disorder;
expression of regions of genomic DNA predicted to encode proteins. They

```
Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein #516 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                         measuring human gene expression in a sample derived from human heart (see MaA21552-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, human heart and vascular system e.g. cardiovascular diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/published_pot_sequences

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphona, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                      Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human brain expressed single exon probe encoded protein SEQ ID NO: 25970.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                            The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring buman gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression
                                         Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia;

in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding 973 human testicular antigen polypeptides, useful for preventing, diagnosing and/or treating testicular cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide #543 encoded by probe for measuring human breast gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

The present invention relates to novel single exon nucleic acid probes (see AA100010-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic inflammationsy diseases include: breast canner, disorders of development, breast disease and non-carcinoma tumours. Note: The sequence data for obtained in electronic format directly from WIPO at

```
The interior Teatace to a spatially-addressable set of single exon mucleic acid probes for measuring gene expression in a sample derived from the mann lung comprising single exon nucleic acid probes for measuring gene expression in the specification, or their complements or the 1337 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridises at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample carried from human lung, comprising (a) contacting the array with a sample carray; identifying exons in a enkaryotic genome, comprising (a) contacting the array with a caray; identifying exons in a enkaryotic genome, comprising (a) and long from human lung measuring the label detectably bound to each probe of the enkaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from enkaryote lung mRNA, to a single exon probe, the enkaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from enkaryote lung mRNA, to a single exon probe, the above mentioned microarray; assigning exons to a single exon probe, in the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray; assigning exons to a single exon in classus and/or cell types using hybridisation to a single exon microarray having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types using hybridisation to a single exon microarray having a probes of itsuses and/or cell types using hybridisation to a single expression captured mRNA and for the struct probes of itsuses and for identifying exons in a gene; particularly using human lung diseases such as asthma, lung derived mRNA and for the struct pulmonary disease (LDD), interstital lung cancer, chronic obstructive pulmonary disease (LDD), interstital lung cancer, chronic obstructive pulmonary places are used for gene expression of the summon structure pulmo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a spatially-addressable set of single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to polymucleotides encoding novel human proteins or taised against the polypeptides, polymucleotides and antibodies traised against the polypeptides are used in a method of treatment of a marmal and prevention of disorders caused by the aberrant protein mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight care used to identify compounds which bind to the polypeptides.

CC expression or activity. The polypeptides can be used as probes and primers, for are used to identify compounds which bind to the polypeptides.

CC encombinant proteins, and in generating anti-ense but or argued the invention can be used to target drugs to a therapy. Polypeptides of the invention can be used to target drugs to a cumour, in assays to determine pological activity, to raise therapy. Polypeptides of the invention can be used to target drugs to a cumour, in assays to determine pological activity, to raise antibodies/elicit an immune response, to determine quantitative protein can be useful in treating platelet disorders, set me cell disorders, regenerating bone, cartilage, tendon, contraceptive, treating osteoporosis and osteoarthritis, anamamia, contraceptive, treating osteoporosis and osteoarthritis, anamamia, allery, asthma, graft-oversus-host disease, eczema, haemphilia, thrombosis, anti-inflammatory contraceptive inflammatory contraceptive appropriation of the invention.

C fungal infection or from autoinmunity, cancer, allery, artical accement eaquence contraceptive inflammatory contraceptive appropriation of the invention.

Novel human diagnostic protein #9878.

13-FEB-2002 (first entry)

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AA019310) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce cytokine, cell proliferation or cell differentiation or which may induce cytokine, of other cytokines in other cell populations. The production of other cytokines in other cell populations. The polypeptides have various cytokine-like activities, cell growth factor activity, haematopoiesis regulating cativity, tissue growth factor activity, immunomodulatory activity and citivity, immunomodulatory activity and citivity, immunomodulatory activity and citivity in the diagnosis and/or citiammation. Note: The sequence data for this patent did not form part cof the printed specification, but was obtained in electronic format directly from MIPO at fitp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                               Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 20; SEQ ID NO 18600; 1399pp + Sequence Listing; English.
                                                                                    AAO04708 standard; protein; 45 AA.
                                                                                                                                                                                               Human polypeptide SEQ ID NO 18600.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tang YT, Liu C, Drmanac RT;

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

biodiversity.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creattion (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used can in recombinant production of (II). The polymucleotides are also used genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or totreat disease states involving (II). (II) is useful in gene therapy techniques to restore normal crivity of (II) or totreat disease states involving or quantitating a setul for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and (II) are useful in medical imaging of supplement. (II) and (II) are useful for treating disorders of supplement. (II) and (II) are useful for treating disorders of involving aberrant protein expression or biological activity. The copynyphide and polymucleotide sequences have applications in capponishing for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cond sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this coptent format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

                                                                                                                                                                                                                                                           This sequence represents a human transaldolase (TAL-H) protein fragment. This protein fragment can be used in methods to raise antibodies for detecting human transaldolase-mediated neurodegenerative autoimmune diseases, especially multiple sclerosis. The protein has neuroprotective properties and is a proliferation, cytotoxicity and binding inhibitor. (Updated on 20-MAR-2003 to correct PF field.)
                                                                                                                                                                                                       Isolated human transaldolase gene - useful for raising antibodies for detecting neurodegenerative autoimmune diseases, especially multiple

                                                                                                                                       The present invention describes a human transaldolase protein molecule (TAL-H). Peptides (1) derived from TAL-H which comprise at least 1 T cell epitope or at least 1 B cell/antibody epitope are also described. TAL-H or (1) induce a transaldolase-specific immune response. TAL-H (I) and antibodies to TAL-H or (1) are useful for diagnosing and treating multiple sclerosis and other human immune-related neurodegenerative diseases. The present sequence represents a specifically example of a TAL-H peptide, from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, digestive system antigen, gene therapy; cancer; appendicitis,

The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer. Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a digestive system antigen of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of the digestive system, particularly cancer and cancer metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 11; SEQ ID NO 2162; 986pp; English.

The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activity, activity, tissue growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and extined may be useful in the diagnosis and/or tradtment of cancer, leukaemia, nervous system disorders, arthitis and tradtment of cancer, leukaemia, nervous system disorders, arthitis and ciffammation. Note: The sequence data for this patent did not form part directly from WIPO at ftp.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                        Human; cytokine; cell proliferation; cell differentiation; gene therapy;
vaccine; peptide therapy; stem cell growth factor; haematopoiesis;
tissue growth factor; immunomodulatory; cancer; leukaemia;
nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 20; SEQ ID NO 19124; 1399pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1.8%; Score 6; DB 4; Length 47;

The present invention relates to the isolation of novel human colon seasociated polypeptides, and the cDNA (AAS19148-AAS19591) and genomic sequences encoding for them. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders of the colon including colon cancer, congenital abnormalities (e.g. atresia and stenosis), bacterial and viral infections, inflammatory bowel disease (IBD), neoplastic cell disorders (e.g. polyps and adenomas, intestinal inflammatory disorders, colitis, colonic inflammatory of arrhoea and dysentery, malabsorption syndromes (e.g. lactose intolerance), intestinal obstruction and sigmoid diseases. The polymocleotides sequences of the invention can also be used in gene therapy. AAU22468-AAU22701 represent the novel human colon associated polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed set form, with was obtained in electronic format directly from WIPO at fire, with was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps
                                                                                                                                                                                                    Isolated polypeptide for treating, preventing and/or prognosing disorders related to the colon including colon cancers and also for testing and detection e.g. diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gene therapy, cancer; liver disorder; hepatitis; neural disorder; Alzheimer's disease; human; colon.

The invention relates to an isolated nucleic acid molecule encoding a polypeptide. The nucleic acid is useful for preparing a medicament for

Claim 12; SEQ ID NO 445; 216pp; English.

```
This invention relates to novel nucleic acid molecules, and encoded proteins thereof, which are present in normal and neoplastic endometrial cells. Specifically, it refers to the use of these endometrial specific nucleic acids (ESNAs), as well as suitable antibodies, agonists and antagonists that are useful for the identification, diagnosis and menitoring of endometrial cancer. The present invention describes a method for monitoring the presence of an endometrial specific protein in a sample (potentially representing metastases) that comprises contacting the sample with a reagent and detecting the intensity of this interaction. Accordingly, via gene therapy, these ESNAs are useful for preparing a cytostatic composition for diagnosing or treating endometrial specific composition for diagnosing or treating endometrial polypeptide of the invention.
                                                                                                                                                                                                                      ö
preventing, treating or ameliorating a medical condition e.g. cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. The present sequence represents the amino acid sequence of a human novel colon related polypeptide. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Endometrial specific protein identified as DEX0379_20_aa_1 (SeqID 169).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid, useful for preparing a composition for diagnosing or

```
The invention relates to the isolation of genes AAC59624-C59669 encoding the human secreted proteins AAB34439-B34484. This sequence represents a perticular fragment homologous to the protein encoded by the gene isolated in the present invention. The sequence is used as a query sequence for in the present invention. The sequence is used as a query sequence for doing BiASIX searches to determine homologous sequence to the protein. The apenes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (antiagonists of specification in the diagnosis, treatment and prevention of: (a) cancer, c.g. breast and ovarian cancer, and other cancers of the adrenal gland, c.g. breast and ovarian cancer, and other cancers of the adrenal gland, c.g. breast and ovarian cancer, and other cancers of the adrenal gland, c.g. urogenital; (b) immune disorders e.g. Addison's disease, allergies, c.g. autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, c.g. colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and c.g. epilepsy; and (f) infectious diseases such as viral, bacterial, fungal

cancer-associated nucleic acid molecules (N) and proteins notion cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome cyptession by rectifying mutations or deletions in a patient's genome consupplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                            AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon

Birse CE,

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Example 1; SEQ ID NO 6760; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgatical. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies opecific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as therefore treat P. acnes infections. The antibodies may also be used as dayanostic agents for determining P. acnes presence, for example, by conzyme linked immunosorbent assay (ELISA). Note: The sequence data for this parent did not form part of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but was the construction of the printed specification, but we can be constructed the construction of the printed specification of the printed specification of the printed of the pri ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)
encoding a Propionibacterium acnes protein. The invention also relates to
polympoptides encoded by the polymucleotides. The invention
additionally encompasses expression vectors and host cells comprising a
additionally encompasses expression vectors and host cells comprising a
polymucleotide of the invention; antibodies against polympoptides of the
invention; funion proteins comprising a polympoptide of the invention; a
configuration of the invention; and an isolated T cell population comprising T cells prepared
control this method; a vaccine composition (comprising T cells prepared
configuration cells that express the polympoptide; and an isolated
configuration of the capter of the populations, or
configuration of the capter of the polympoptide; and an isolated
configuration of the capter of the polympoptides, and the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of the capter of

Maisonneuve JL; Jones R, Carter D;

Bhatia A, Benson DR,

Persing DH, Lodes MJ,

invention relates to an isolated polynucleotide (ACF64435-ACF64733) Example 1; SEQ ID NO 3494; 1481pp; English.

```
The inventor branch to an Isolated polymorecorde (ACK64435, ACK64433)

conciding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymorecordes (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a colymposition of the invention; anniholdies against polypeptides of the invention; fusion proteins comprising a polypeptide of the invention; an immune response specific for a P. acnes

Co polymposition proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes

Co polymposition and an isolated T cell population comprising P. acnes polypeptides, antibodies, fusion proteins, T cell populations, or a trism method and kit confidence of the acnes in a selecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and method for inhibiting the development of P. acnes in collypeptides are useful for diagnosing, preventing or treating acceptations or antigen-presenting cells that express the polympositions or antigen-presenting cells that express the collypeptides are useful for diagnosing, preventing or for treating acceptations of an immune response against P. acnes, or for treating acceptation of an immune response against P. acnes, or for treating acceptance adainst P. acnes polymposited by an ORF (open reading frame) contained within the P. acnes polymuclectides of the princed specification, which in the P. acnes polymuclectides of the princelly of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince of the prince
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to oytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell proulations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammalopoidsis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, indubin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form the directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                  Human, cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptidde therapy; etem cell growth factor; haematopoiesis; tissue growth factor; immunomedulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 20; SEQ ID NO 18272; 1399pp + Sequence Listing; English.

human secreted proteins given in AAC59566 to AAC59614 encode the human secreted proteins given in AAB34299 to AAB34347. AAB34348 to AAB343437 represent human secreted polypeptide sequences and proteins considered by the proteins and colored by the proteins have activities based on the tissues invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Example of activities include: convergorective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; and antibacterial. The polynucleotides can be used for the detection of various disorders such as cancer, chromosome cidentification, as chromosome markers, and for numerous other diagnostic or research purposes. The secreted proteins can be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmanary, cardiovascular, remai, and proliferative disorders, wound healing, and infectious diseases. The proteins can also be used as a food additive or preservative to increase or decrease sequences used in the exemplification of the present invention

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. C. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The colypeptides may be used as antigens in the production of antibodies placing the amount of bound protein in the sample. The colypeptides may be used as antigens in the production of antibodies of therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes proteins. The acnes polypeptides and ctivity of P. acnes polypeptides may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was ö SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; polypeptides and nucleic acids useful for diagnosing infections, especially useful for Gaps · 0 Mitcham JL, Wang SS, Bhatia A; , Jen S, Carter D; 0; Indels 1.8%; Score 6; DB 4; Length 53; 100.0%; Pred. The invention relates to an isolated polymucleotide (ACF64435-ACF64733) encoding a Propionibacterium acres protein. The invention also relates to encoding a Propionibacterium acres protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64536) and to additionally encompasses expression vectors and host cells comprising a diditionally encompasses expression vectors and host cells comprising a polypeptide of the invention; and misclated T cell population comprising T cells prepared invention; the invention; and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising T cells prepared via this method; a vaccine composition (comprising T cells proputides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P, acres in a patient; and a method for inhibiting the development of P, acres in a patient. The P, acres polypeptides, polymucleotides, antibodies, fusion protein. The P, acres polypeptides, preventing cells that express the polymucleotides can also be used as probes or priners for outlears, or for stimulations or antigen-presenting cells that express the protein. The polymucleotides can also be used as probes or priners for nucleic acid hybridisation. The vaccine composition is useful for the simmune response against P, acres polymucleotides can also be used as probes or priners for cucleic acid hybridisation. The vaccine composition is useful for performing a diagnostic assay. The present conding frame) contained within the P, acres polymucleotides of the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly

```
The invention relates to human polynucleotides (AAI19941-AAI93841) and the encoded proteins (AA000010-AA01910) that exhibit activity elating to Oytokine. Call proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammanomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leuksemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                           Human; cytokine; cell proliferation; cell differentiation; gene therapy; accine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

Sequences AMOSIVO-AMOSIVI. TERPLEBER. PROPIOLIZACTERIUM acutes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by the treatment, prevention and diagnosis of medical conditions caused by a conse. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and costcomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central carvance system, however it is particularly involved in the inflammatory lesions system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a cample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The capt and determining as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies con perceit for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes presence, for example, by enzylengence treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzylenged immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was constanted in electronic format directly from WIPO at

(referred to as open reading frame, ORFX, where X is 1-11491 processed in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polymucleotide sequences can be used in Gene therapy. ORFX sequences can be used in the reading disorders, cirrhosis of liver, psoriamis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders mellitus, systemic transplantation, cardiovascular diseases mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage diseases, various immune deficiencies and disorders, infectious diseases, autoimmune thyroiditis, myaethenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ·.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-APR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -NDD-87
The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to encoding a Propionibacterium acnes protein. The invention also relates to collypoptides and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a diditionally encompasses expression vectors and host cells comprising a polypeptide of the invention, antibodies against polypeptides of the invention; any polynuclectide of the invention; and immune response specific for a P. acnes parts polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising T cells prepared to polynuclectides, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a protein. The P. acnes polypeptides, preventing cells that express the collypeptides are useful for indigen-presenting cells that express the polynucleotides can also be used as probes or primers for nucleic acid hybridistation. The vaccine composition is useful for the simmulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present content of the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly contents.
                                                                                                                                                                                                                                                                                                                                                                                                                         New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                               Maisonneuve JL;

                                                                                                                                WO200192523-A2.
                                                                                                          Homo sapiens.
                                                                                                                                                                                                                                                    Shimkets RA,
                                                                                                                                                      06-DEC-2001,
```

Leach MD;

```
The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) in the specification). ABM15762 to ABM27525 encode the human ORFX proteins given in ABB000010 to ABP11500. ORFX proteins are useful for proteins given in ABB000010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polymucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, intending or transplantation, cardiovascular disorders, disorders related to organ cransplantation, cardiovascular disorders, disorders, infectious disease, various immune deficiencies and disorders, infectious disease, various immune deficiencies and disorders, infectious disease, varioummune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also cuseful for treating burns, inforisons, ulcers, for treating obsceporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from cytokine damage. NB. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic correction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 55 AA;

New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.

2002-352536/38.

N-PSDB; ABN66393.

Claim 1; Page 3222; 4525pp; English.

streptococcus/GBS (Streptococcus adalactise) or group A streptococcus/GBS (Streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiniflammatory activity. (I), nucleic acids encoding (I), ABM66044-ABM71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromography, immunoassays, and distinguishing/identifying The invention relates to a protein (ABP25413-ABP30895) from group B Streptococcus proteins

                                                                                                                                                                                                                       Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
